Airport Capacity Assessment and Optimization

Case Study: Roma Fiumicino Airport (FCO)

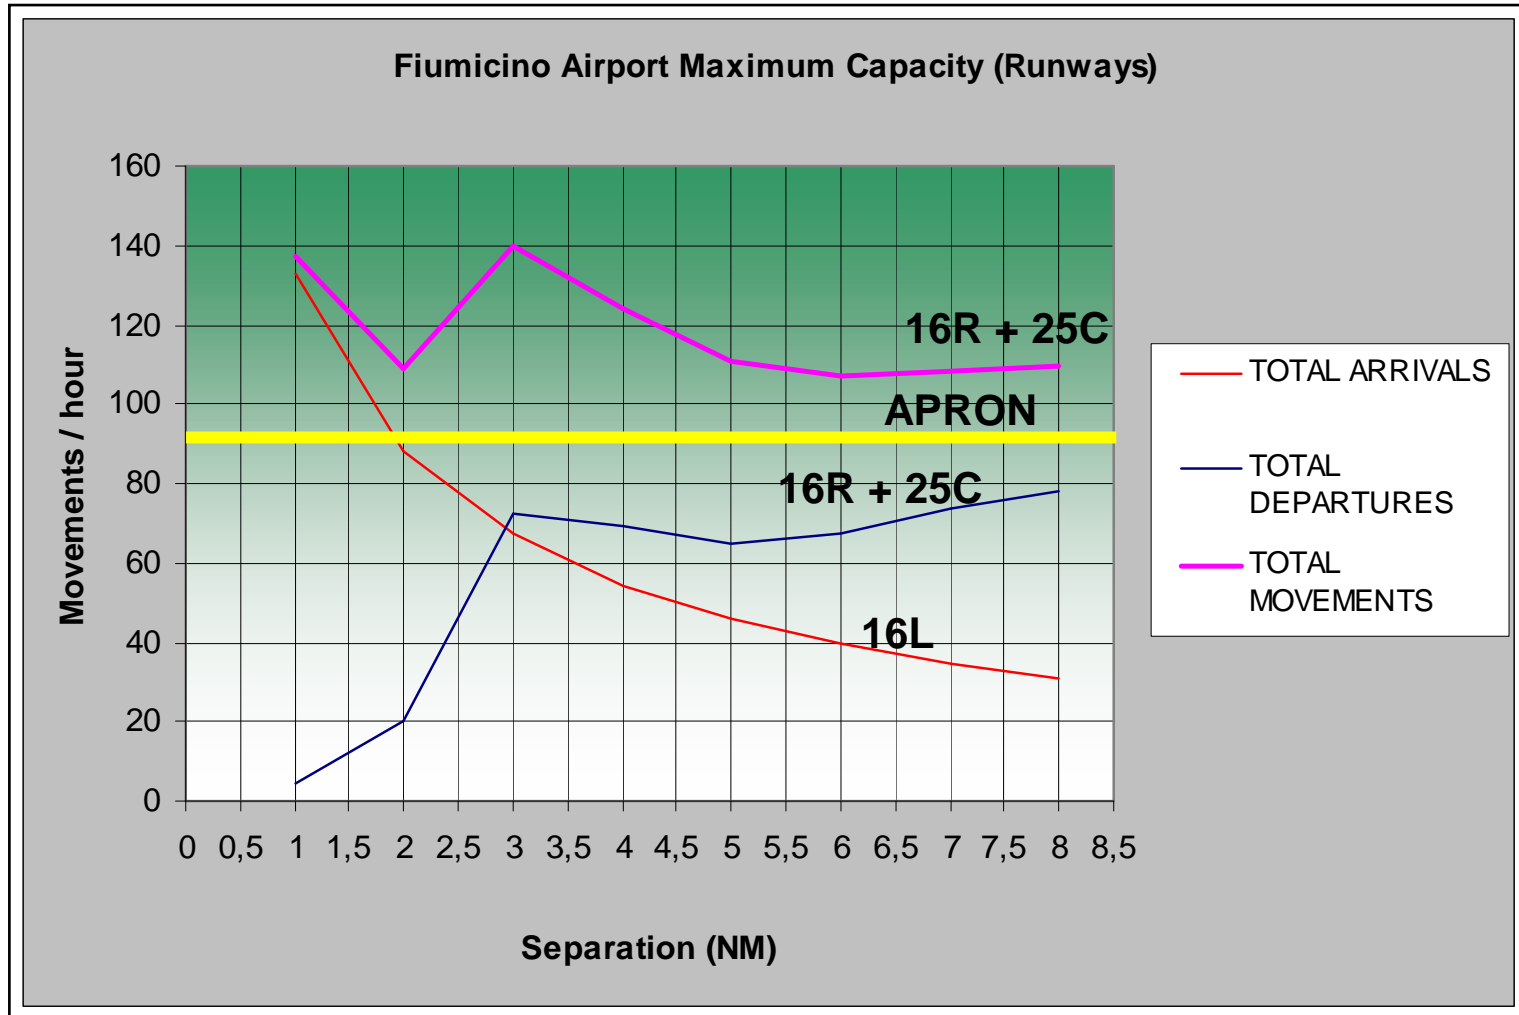

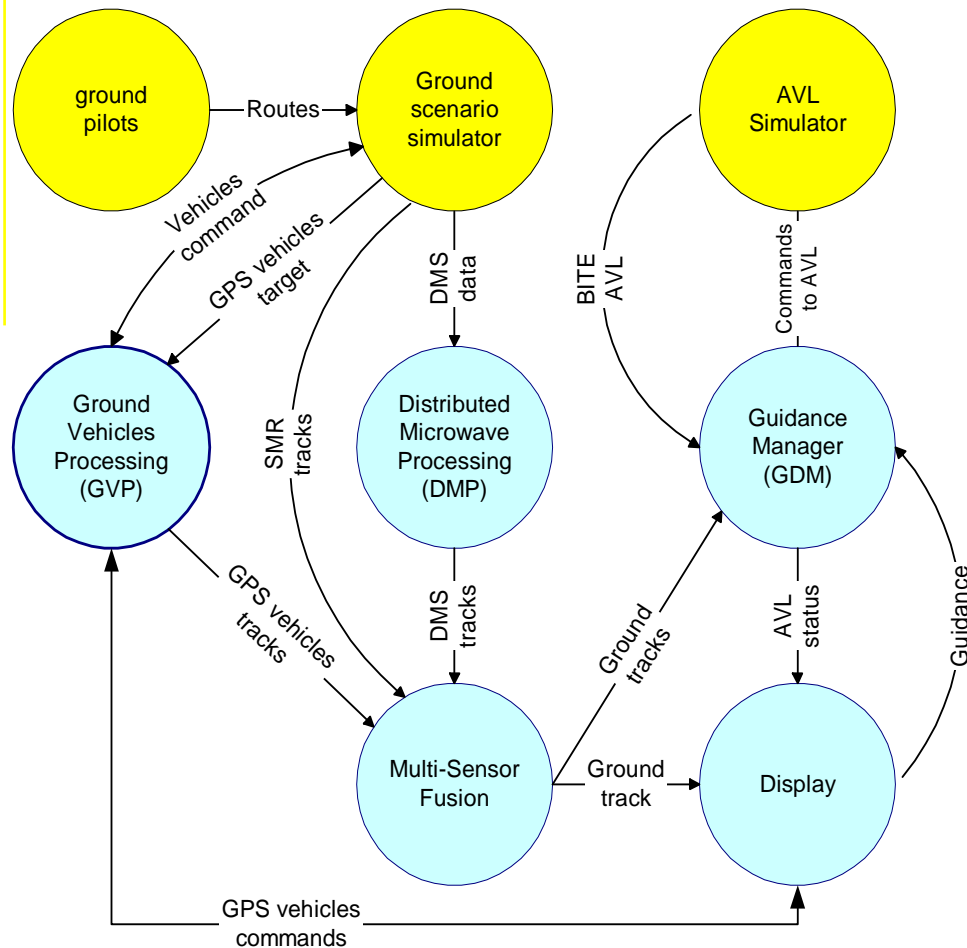

Maximum apron capacity resulted to be equal to 90 movements/hr.

In white, saturation of route segments during the computation of apron capacity.

Case Study: Roma Fiumicino Airport (FCO)

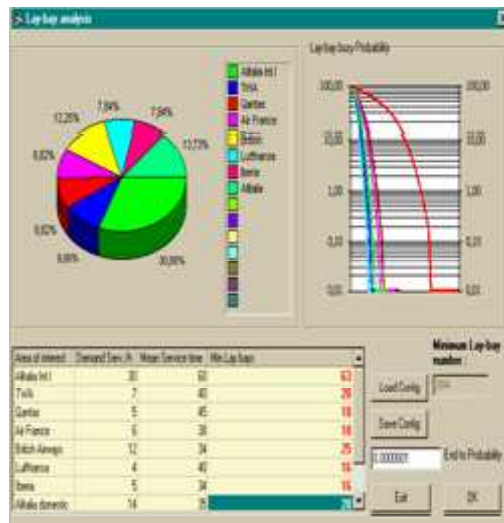

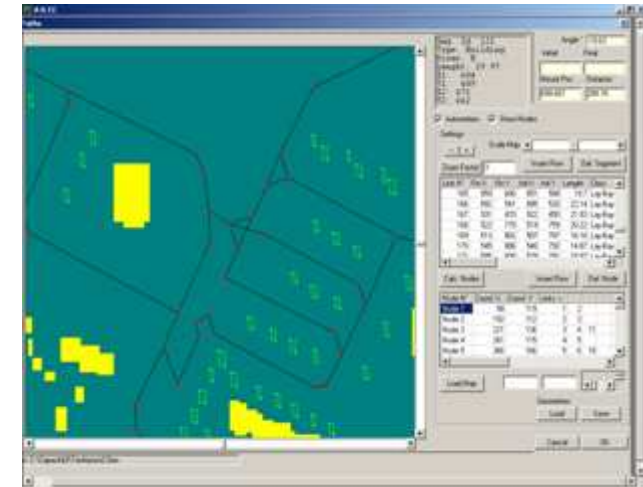

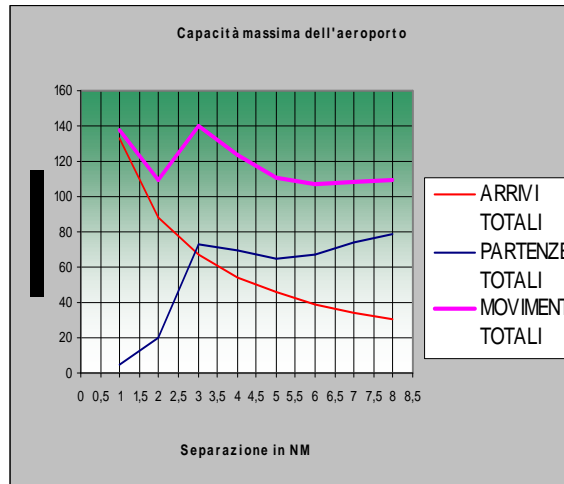

Simulator

- **Ground scenarios simulator.**
 - Aircrafts movements onto taxiways and runway.
 - Vehicles movements inside the airports.
- **Pilots simulator to create routine and emergencies procedures.**
- **Ground sensors simulator (operative and BITE).**
 - Surface movement radar (SMR).
 - Distributed microwave sensors (DMS).
 - GPS reports (only for vehicles).
- **AGL simulator (operative and BITE).**
 - Center Lines and Stop Bars.
 - Taxiway Lighted Signs.
 - Runway Gaurd Lights.

Airport Capacity Assessment and Optimization

The airport capacity simulation model, developed by Argos Ingegneria S.p.A., allows to evaluate:

- airport maximum theoretical capacity;
- airport maximum real capacity (considering existing taxiway, apron, gates constraints);
- airport capacity potential increase, based on specified interventions;
- infrastructures increase based on feasibility studies/master plan.
